Evolution of Gas in Group & Cluster Galaxies

Simulating Galaxies' Gas Loss in Group & Cluster Environments

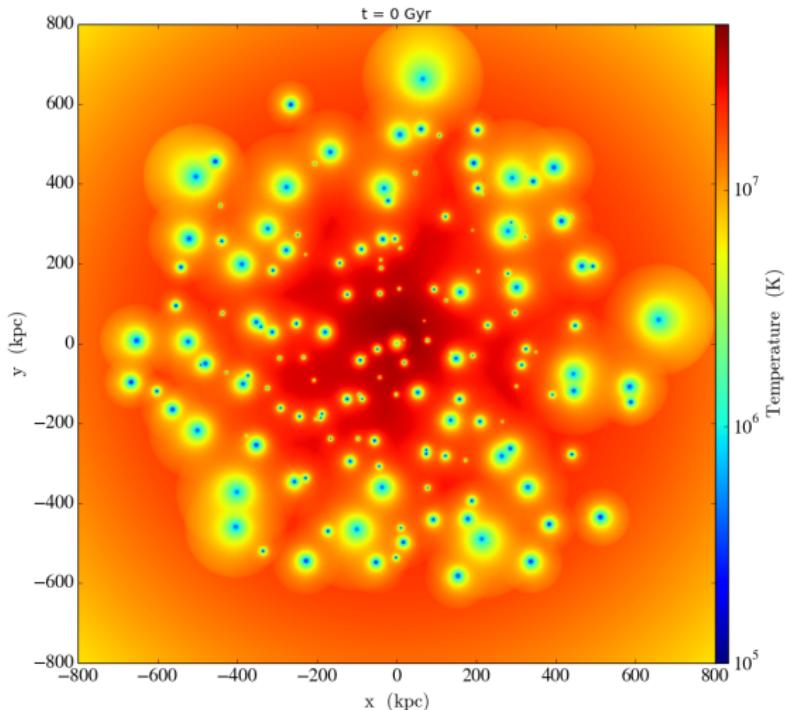

- N-body + Magnetohydrodynamic FLASH 4 simulations of galaxies in isolated group ($M_{\text{group}} = 3.2 \times 10^{13} M_{\odot}$) and cluster ($M_{\text{cluster}} = 1.2 \times 10^{14} M_{\odot}$).
- $10^6 M_{\odot}$ particles, 1.6 kpc maximum spatial resolution.
- 'Galaxies' are NFW spheres with hot gas coronae, live background halo.
- Galaxy masses are chosen from luminosity functions.

Galaxies Amplify Magnetic Fields, Inject Turbulence

$$E_B = B^2 / 8\pi$$

$$E_K = v^2$$

Vijayaraghavan & Ricker 2016, ApJ submitted

Thermal Conduction

$$\mathbf{Q} = -\kappa \nabla T_e$$
$$\kappa = \epsilon \delta_T \kappa_{Sp} \propto n_e \lambda_e T_e^{1/2}$$

$$\lambda_e \simeq 22 \text{ kpc} \left(\frac{T_e}{10^8 \text{K}} \right)^2 \left(\frac{n_e}{10^{-3} \text{cm}^{-3}} \right)^{-1}$$

Thermal Conduction between the ICM and hot ISM: Saturated Heat Flux

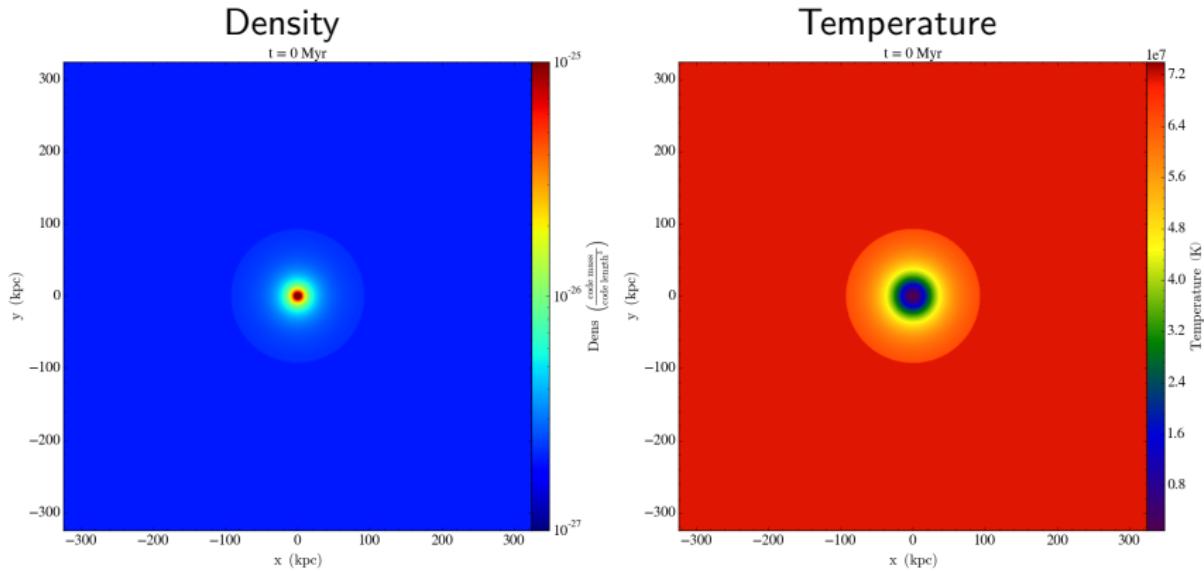

$$Q_{\text{sat}} = 0.4 \left(\frac{2k_B T_e}{\pi m_e} \right)^{1/2} n_e k_B T_e$$

$(l_T \lesssim \lambda_e)$

$$\mathbf{Q}_{\text{eff}} = \left(\frac{1}{\mathbf{Q}} + \frac{1}{\mathbf{Q}_{\text{sat}}} \right)^{-1} = \frac{\kappa T_e}{l_T + 4.2\lambda_e} \frac{\nabla T_e}{|\nabla T_e|}$$

Galaxy in Wind Tunnel

No Conduction

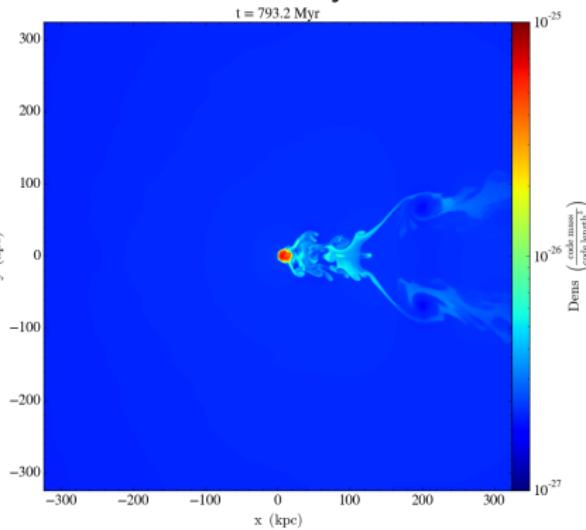

$t = 95$ Myr

$t = 95.13$ Myr

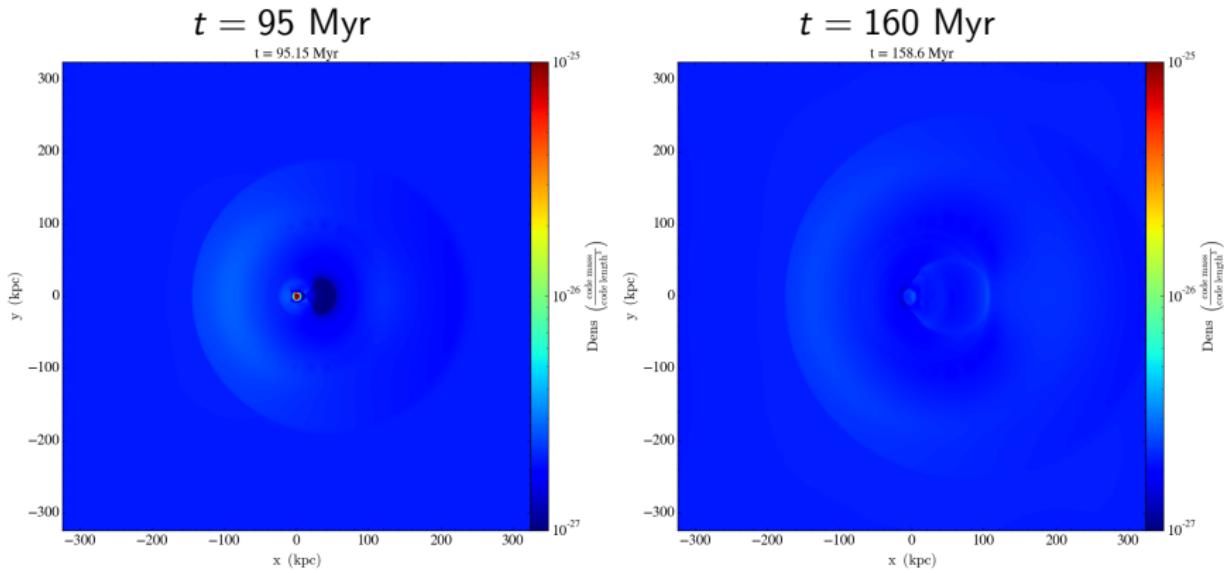

$t = 800$ Myr

$t = 793.2$ Myr

Vijayaraghavan & Sarazin, in prep.

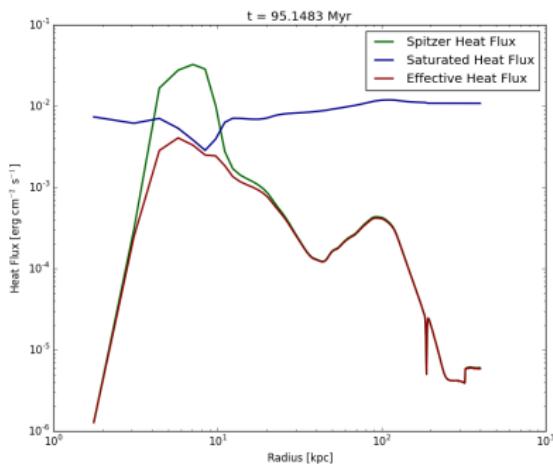

Isotropic Saturated Thermal Conduction

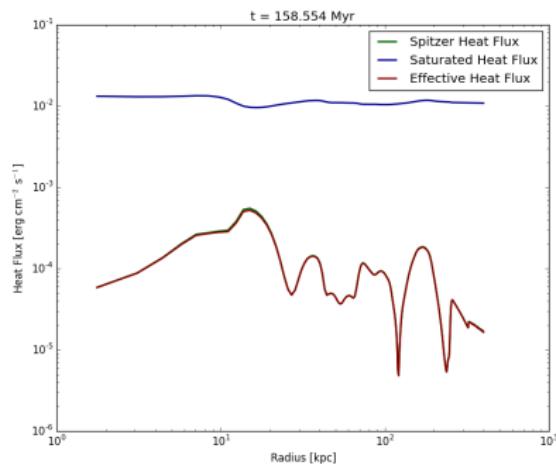

Vijayaraghavan & Sarazin, in prep.

Effective Heat Flux

$t = 95$ Myr

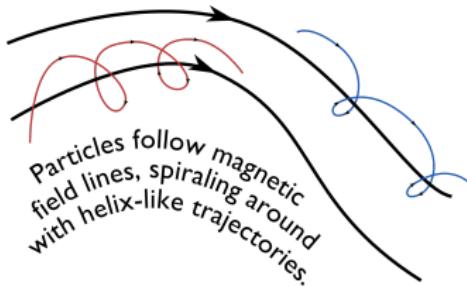

$t = 160$ Myr

Vijayaraghavan & Sarazin, in prep.

Anisotropic Thermal Conduction

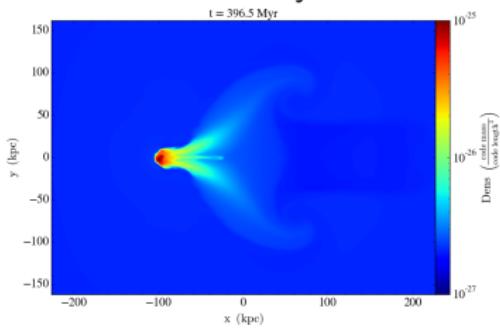

- In the ICM, electron $r_g \ll \lambda_e$
- $r_g \sim 10^8$ cm; $\lambda_e \sim 1 - 10$ kpc
- $\mathbf{Q}_{\text{Spitzer}} = -\kappa \hat{\mathbf{e}}_B (\hat{\mathbf{e}}_B \cdot \nabla T_e)$
- Four magnetic field orientations:
 - $\mathbf{B} \parallel \mathbf{v}_{\text{ICM}}$, continuous
 - $\mathbf{B} \perp \mathbf{v}_{\text{ICM}}$, continuous
 - $\mathbf{B} \parallel \mathbf{v}_{\text{ICM}}$ in ICM shielding galaxy, toroidal field in ISM
 - $\mathbf{B} \perp \mathbf{v}_{\text{ICM}}$, in ICM shielding galaxy, toroidal field in ISM

Summary

- Ram pressure strips gas within $t \simeq 2 - 3 \text{ Gyr}$.
- Magnetic fields suppress shear instabilities, but are not strong enough to overcome ram pressure.
- Isotropic saturated thermal conduction evaporates hot ISM gas within 160 Myr; ~ 500 Myr for massive galaxies.
- Anisotropic thermal conduction can suppress evaporation, but ram pressure stripping still effective.
