

Lyman-alpha galaxies in the larger framework of Galaxy formation

S. Malhotra & J. Rhoads

Pirzkal et al. 2007

Dawson et al. 2007

S. Finkelstein et al.
2007, 2008

V. Tilvi et al. 2008

Kovac et al. 2007

Lyman- α galaxies and Galaxy formation

July 8; 2008

IAP: Col2008; Malhotra

Ly- α galaxies:

- have star-formation rates $\sim 10 M_{\text{sun}}/\text{year}$
- are young: $\sim 10^7$ years (Pirzkal et al. 07, Finkelstein et al. 08; Nilsson et al.)
- are not massive: $10^7\text{-}10^9 M_{\text{sun}}$ (Pirzkal et al. 2007, Finkelstein et al. 2008)
- have modest amounts of dust: (poster by Finkelstein et al.)
- have halo masses $\sim 10^{11} M_{\text{sun}}$ (Kovac et al 2007; Gawiser et al 07; Ouchi et al 07)
- Only $\sim 10\%$ of such halos host LyA galaxies (Kovac et al 2007).
- can be reproduced by simple prescriptions for populating halos with LyA (Tilvi et al. 2008)

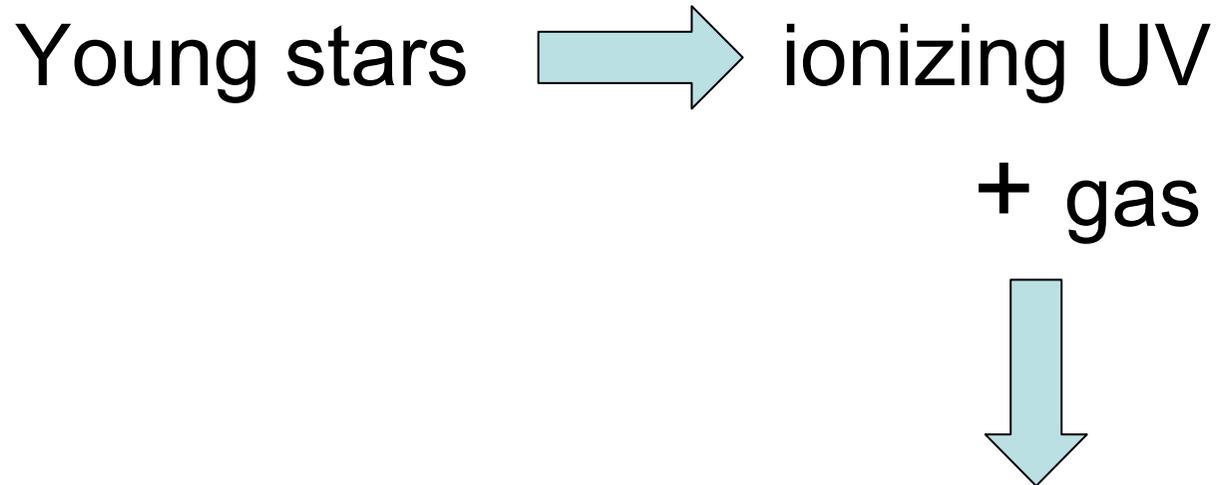

You definitely have
the tail of the
elephant, my friend!

Rix

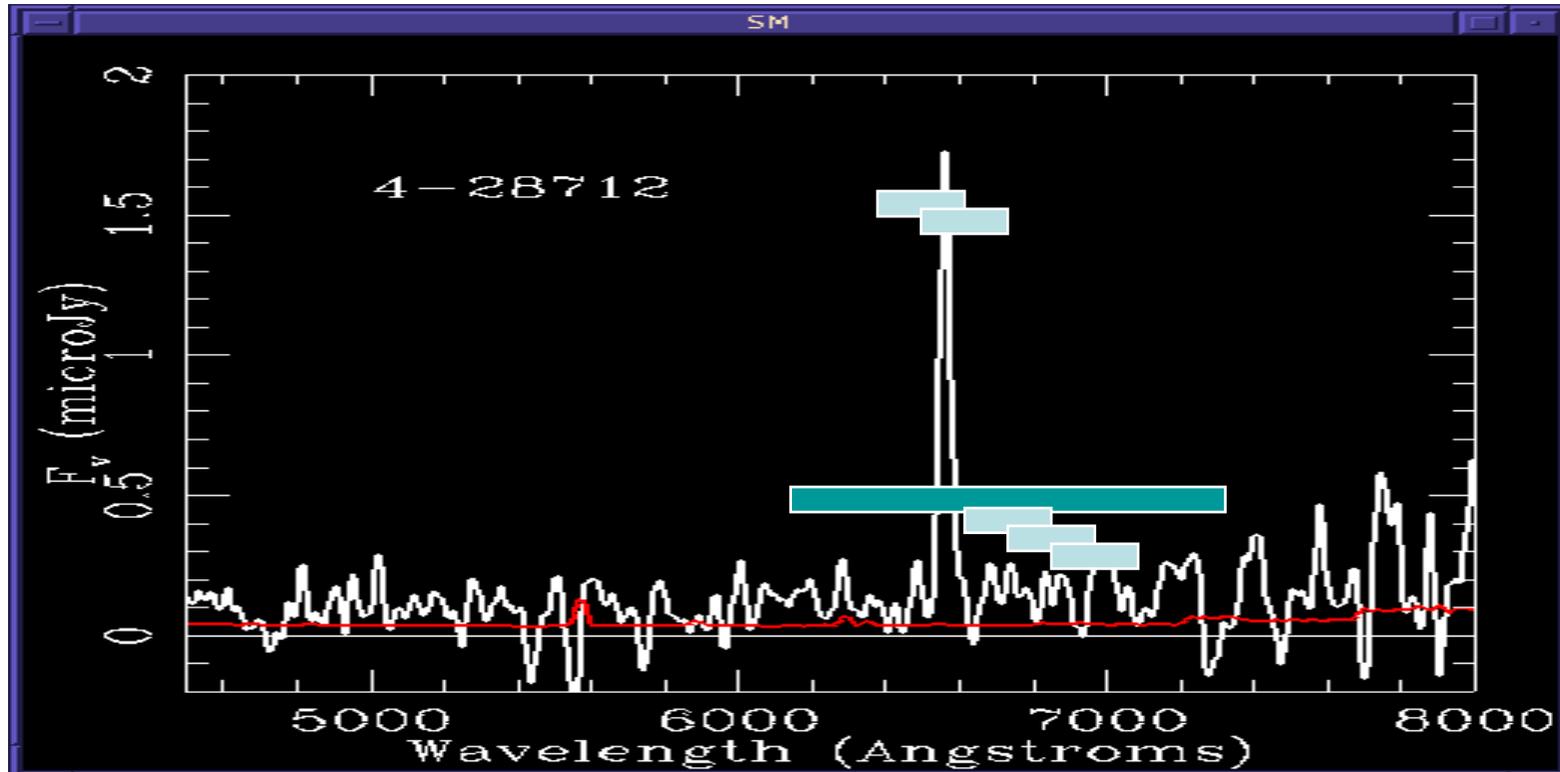

What “*should*” Lyman- α Galaxies be?

6-7% of a young galaxy's luminosity may
emerge in the Lyman- α line.

Partridge & Peebles 1967

What are Lyman- α galaxies? -operational answer

- Practically, I mean a galaxy *selected by its Lyman- α line emission.*

What *are* Lyman- α galaxies?

are needed to see this picture.

Expected equivalent width of Ly α line

Malhotra & Rhoads 2002.

July 8; 2008

IAP: Col2008; Malhotra

Possible explanations:

1. Active nuclei, type II quasars ...
2. Young galaxies
3. IMF skewed towards higher end
4. Pop III stars
5. Dust. Wait a minute, dust !?!

Evidence for Young and Small LyA Galaxies

Testing Radiative Transfer Scenarios

- Continuum spectral slope:
 - Hot stellar photospheres → blue starlight.
 - Dust scenarios → reddened starlight.
- Test with broad band colors: MMT, HST, Spitzer.
 - Wide wavelength coverage helps separate the effects of dust from those of underlying older stars

are needed to see this picture.

Finkelstein et al. 2008a (ApJ 678, 655) and 2008b (ApJ,
submitted):

SED fitting with a new dust parameter 'q':

q=0 implies no dust extinction on Ly α (Neufeld model)

q=1 implies Ly α is extinguished just like continuum

q \gg 1 is the regime of strong extinction due to multiple resonant
scatterings.

Chapman et al. 2003: Submm galaxies show Ly α

Halo Mass and Duty Cycle

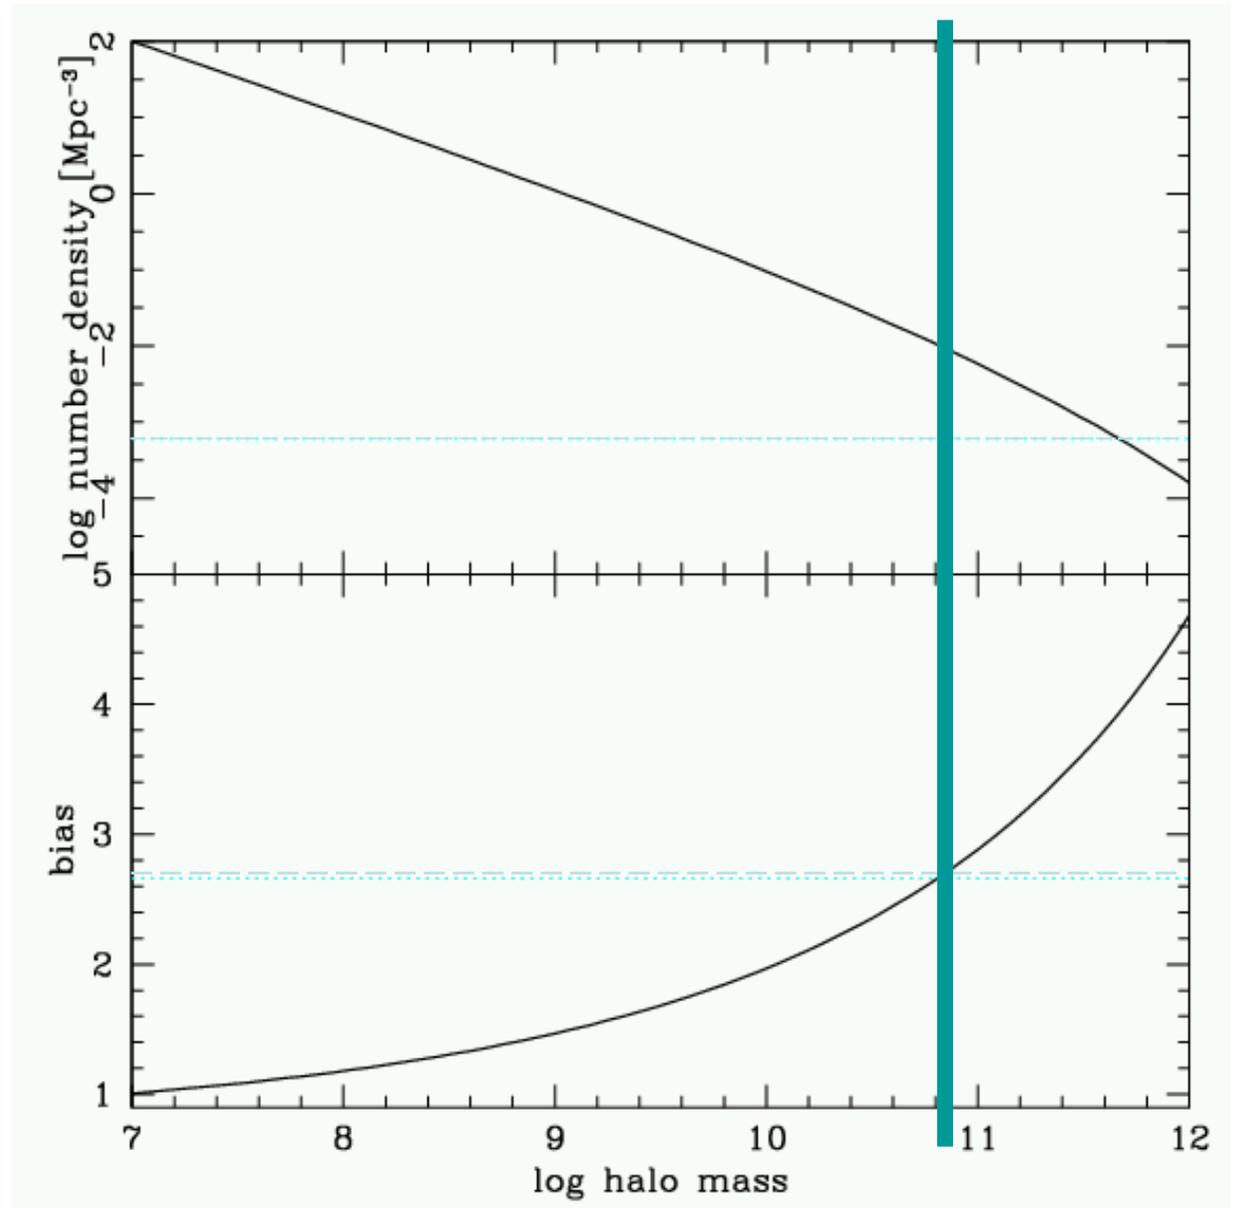

- Spatial correlation length implies halo masses around $10^{11} M_{\text{sun}}$.

July 8; 2008

Halo Mass and Duty Cycle

- Spatial correlation length implies halo masses around $10^{11} M_{\text{sun}}$ at redshift $z = 4.5$.
 - Number counts are lower. This suggests duty cycle $\sim 10\%$ for the Lyman-alpha phase
- (Kovac, et al. 2007)

July 8; 2008

Simulating LyA Galaxies:

(Tilvi, Malhotra, Rhoads, Scannapeico, Iliev, Mellema 2008)

- Halos from N-body simulations
 - are Lyman alpha emission if they are
 1. Accreting actively, and
 2. Below a cutoff mass threshold.

QuickTime™ and a
decompressor
are needed to see this picture.

Modelling LyA Galaxies in Simulations (Tilvi et al 2008)

QuickTime™ and a
TIFF (LZW) decompressor
are needed to see this picture.

QuickTime™ and a
TIFF (LZW) decompressor
are needed to see this picture.

We reproduce the

1. luminosity funct:
2. ages,
3. stellar masses
4. equivalent widths.
5. Correlation lengths
