

OSIRIS:

(Optical System for Imaging and low
Resolution Integrated Spectroscopy)

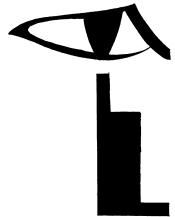

SURVEYING THE Ly α UNIVERSE

FROM Z = 7 TO 2

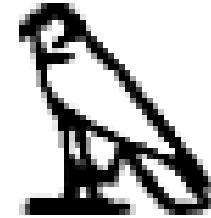

Jordi Cepa (OSIRIS PI)

Instituto de Astrofísica de Canarias/U. La Laguna

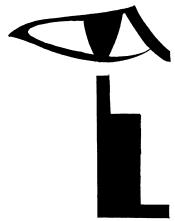

On behalf of OSIRIS, and OSIRIS survey teams

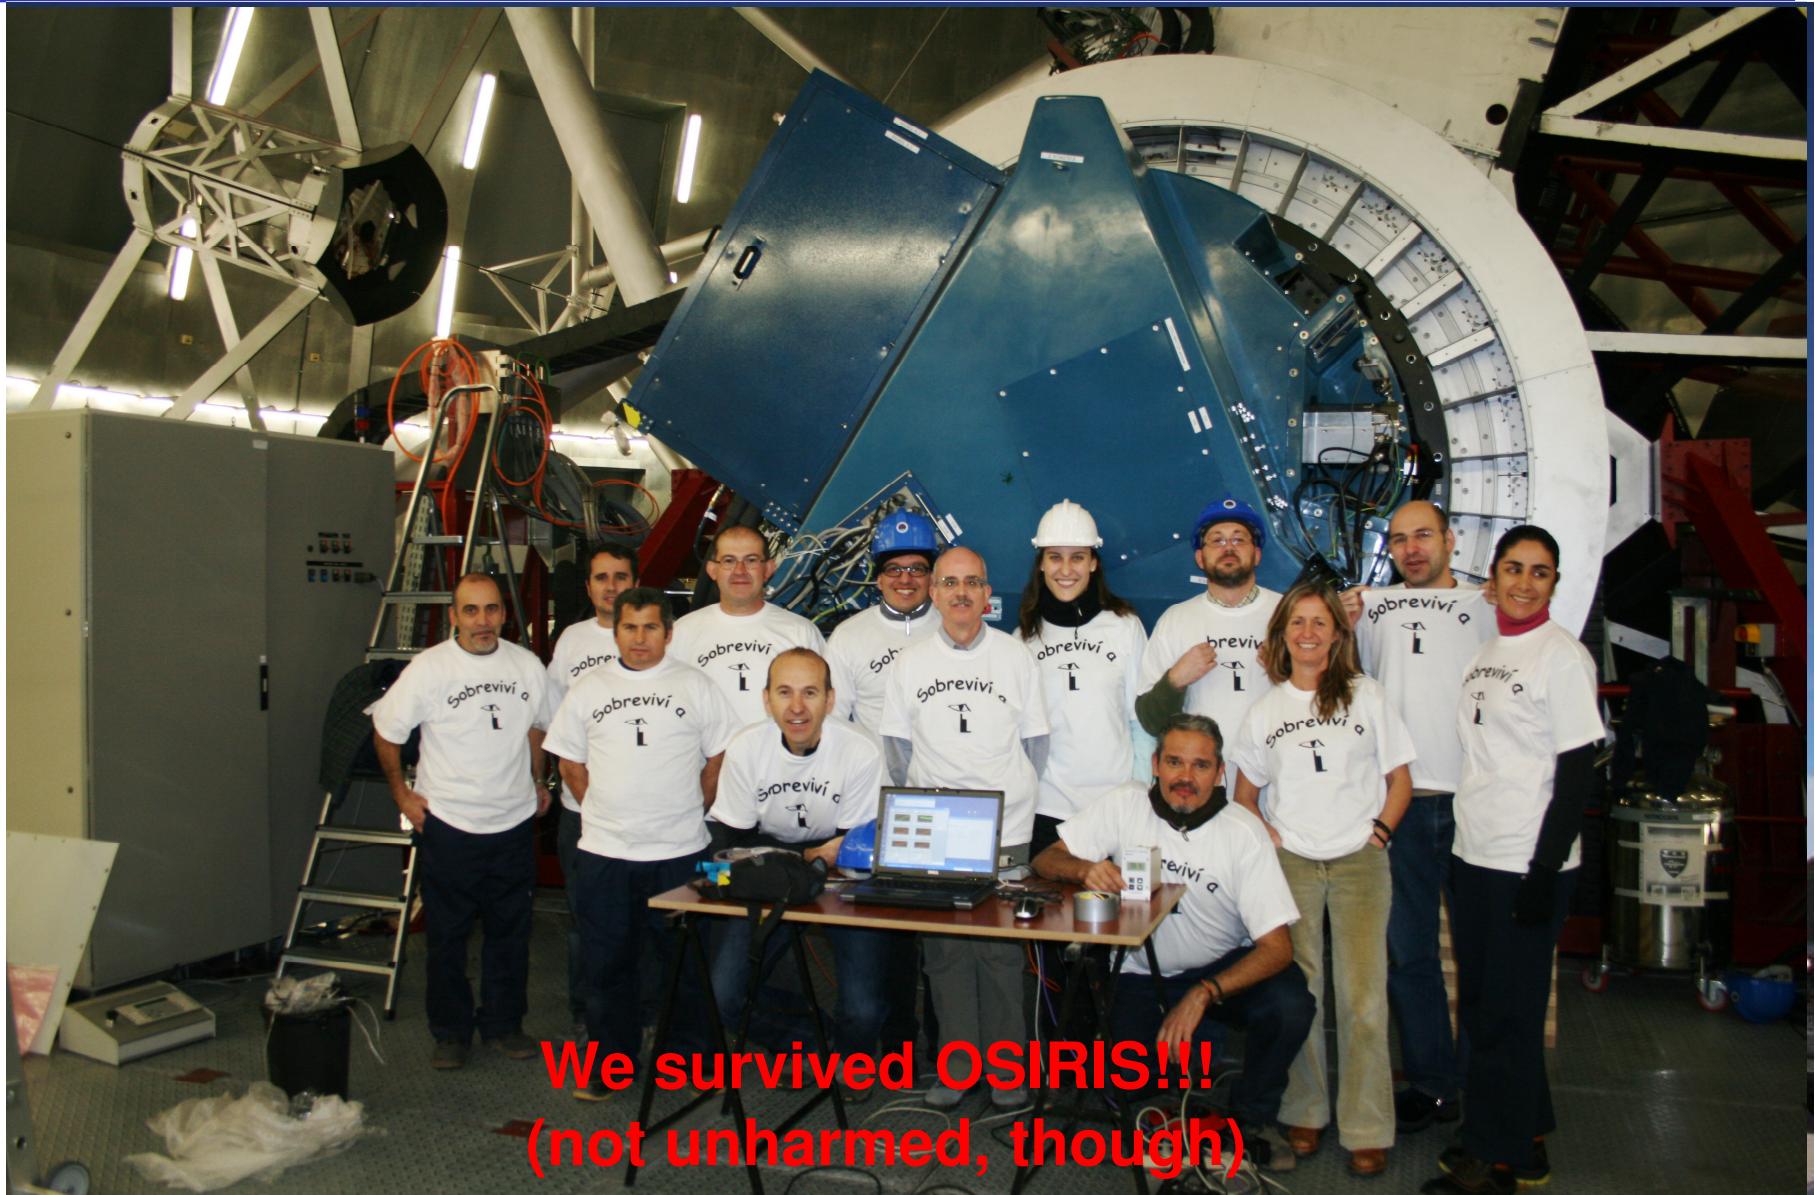

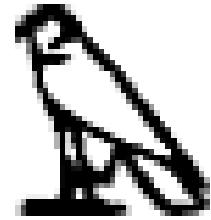

OSIRIS basics

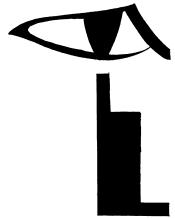

- Camera-Spectrograph for the GTC 10.4m telescope
- Wavelength range: 3650 to 10000 Å
- FOV $8.5' \times 8.7'$
- Imaging
 - ugriz
 - Medium band
 - Tunable filters
- Spectroscopy:
 - Long slit & MOS
 - R = 300 to 5000
- Fast modes (photometry & spectroscopy)
- Shuffle modes in tunable imaging & MOS

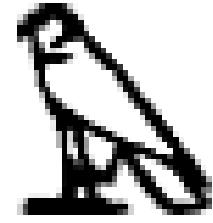

OSIRIS @GTC

Tunable filters

- **OSIRIS tunable filters**

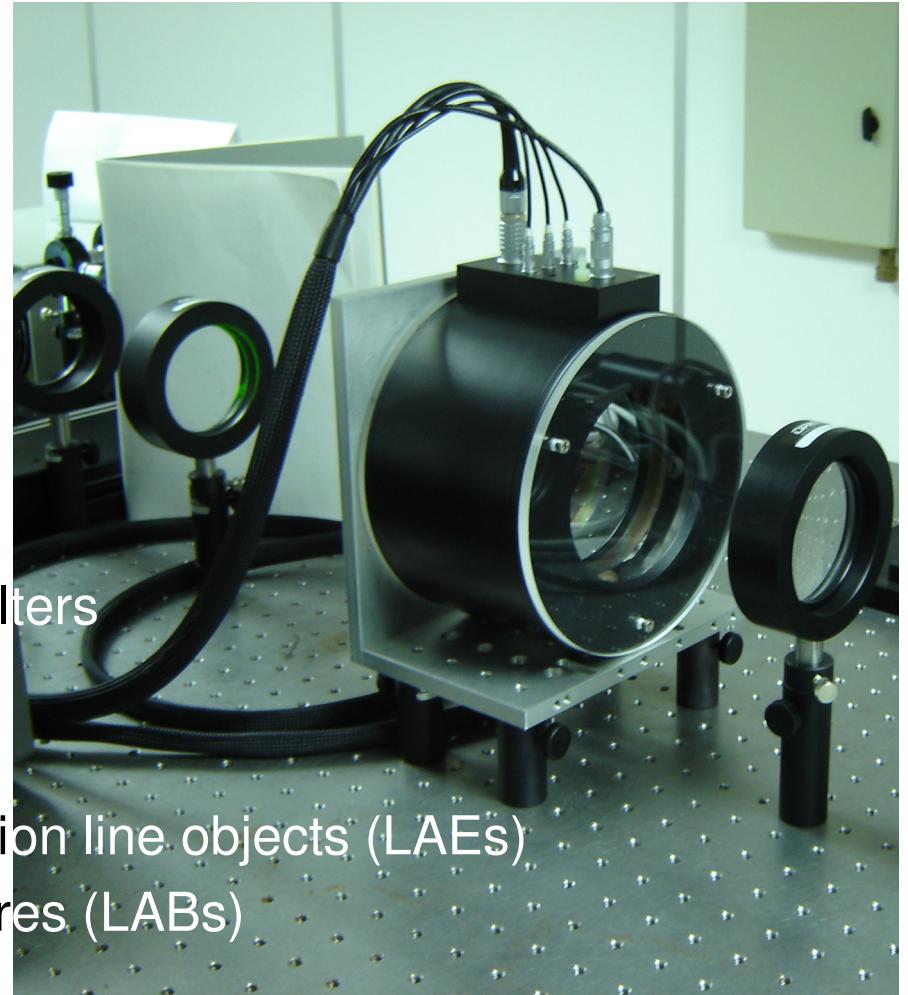

- Wavelength range 3650 to 10000 Å
- Tuning accuracy 1 Å
- Tuning time from 10 to 100 ms
- Minimum FWHM from 6 to 12 Å

- **Some advantages**

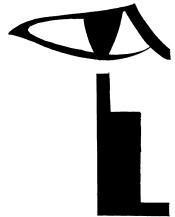

- Narrower than most available filters
- Higher efficiency than conventional filters

- **then,**

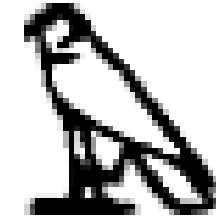

- Better matched for OH sky windows
- Very efficient detection of faint emission line objects (LAEs)
- Idib. for faint diffuse emission structures (LABs)

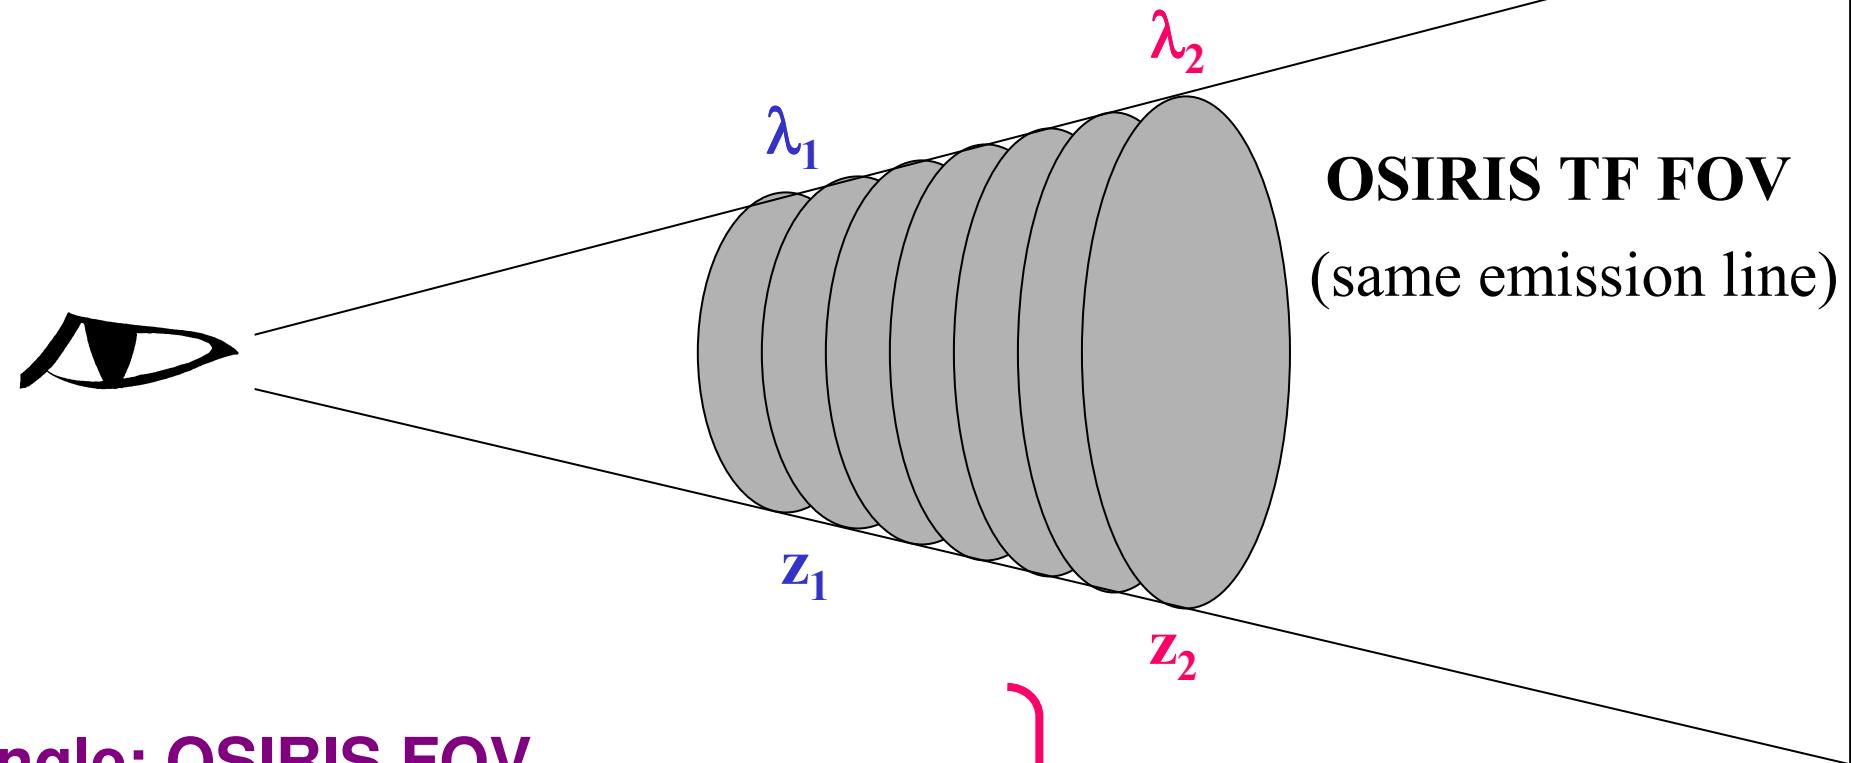

and in a 10m telescope!!!

Tunable Tomography

Allow Ultra-Deep Emission Line Surveys using TF

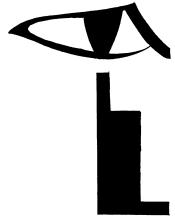

Angle: OSIRIS FOV

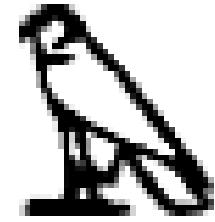

Heigh: $\Delta\lambda$ scanned = $\lambda_2 - \lambda_1$

Limiting magnitude: exposure time

Limited flux survey of a perfectly defined volume of Universe

OSIRIS Tunable Surveys: OTELO & HORUS

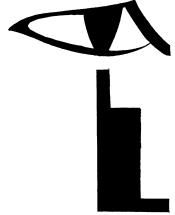

- **OTELO**

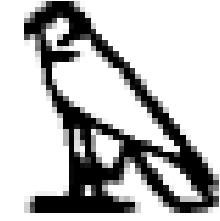

- OSIRIS Tunable Emission Line Object survey
- Scan the windows through OH sky lines at 815, 925 & 975 nm
- Ly α at $z = 5.6, 6.7$ and 7.0 (priority 6.7 & 7.0 at highest depth)

- **HORUS**

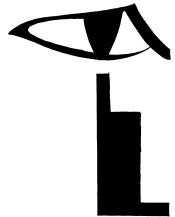

- Hydrogen and Oxygen Recombination lines Unified Survey
- Scan wavelengths around 389, 426, 499 & 584 nm
- Ly α at $z = 2.2, 2.5, 3.1$ & 3.8 (priority 2.2 at highest depth)

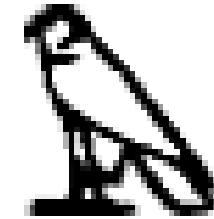

OSIRIS Tunable Surveys: Characteristics

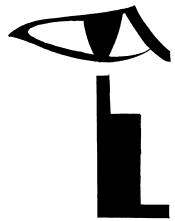

- In general, Ly α luminosity limit $\sim 10^{41}$ erg/s at every z
- But at selected pointings, $\sim 10^{-18}$ erg cm $^{-2}$ s $^{-1}$ (5 σ) for every z
- Minimum detectable EW $\sim 2\text{-}3$ at the deepest flux limit
(EWs useful for our cherished outliers!)
- Goal: 0.1 sq. degrees
- Pointing at:
 - SXDS, COSMOS, GOODS-N, EGS (ancillary data)
 - Some QSO fields at z_{QSO}
- First phase: 25 nights (guaranteed time) starts October 2009
- OSIRIS follow-up spectroscopy at R=5000 for kinematics
- NIR GTC follow-up looking for optical lines at z = 2-4

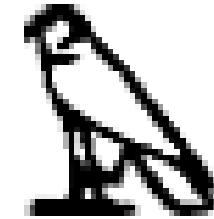

Why another survey?

- **Going deeper** ($\sim 10^{-18}$ erg cm $^{-2}$ s $^{-1}$ at 5σ with $\text{EW} \geq 2\text{-}3$)
- **Detecting fainter surface brightness**
- **Coherent dataset at every z** (same observational technique)
- **Accurate continuum subtraction**
 - well known filter spectral response
 - sampling nearby the emission line
 - not including the line within continuum
- **Accurate flux calibration**
- **Accurate redshift determination** ($\Delta z/(1+z) \sim 10^{-3}$, same data)
- **Possible detection emission outflows using the same data**
- **In summary: pushing to the limit a 10m telescope with TF**

Team

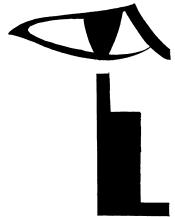

OTELO & HORUS

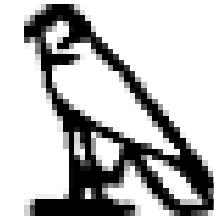

Jordi Cepa (IAC, OTELO PI, HORUS Co-PI)
Emilio Alfaro (IAA)
Ángel Bongiovanni (IAC)
Héctor Castañeda (IPN)
Jesús Gallego (UCM, HORUS Co-PI)
Ignacio González-Serrano (IFCA-UNICAN)
Ana Pérez-García (IAC)
José Miguel Rodríguez-Espinosa (IAC)
Miguel Sánchez-Portal (ESAC-INSA)

HORUS

Jérémie Blaizot (U. Lyon)
Stéphane Charlot (IAP)
Jean-Gabriel Cuby (LAM)
Johan Fynbo (KU, Sweden)
Rafael Guzmán (U. FI.-UCM)
Kim Nilsson (MPIA)
Ian Parry (IOA)
Roser Pelló (Toulouse)

Products: Ly α & outliers

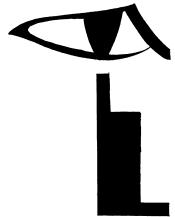

But... *Quicquid nitet notandum* (William Herschel moto)

Morphological Type	Maximum redshift	Expected number
E/S0	0.84	$3 \cdot 10^4$
Sa-b-c-d-Im	1.50	
Sy	1.50	$7 \cdot 10^3$
BCD	0.84	10^3
Ly α	7.00	10^3

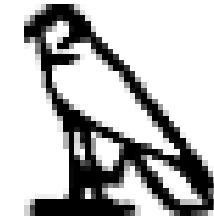

Plus LABs (beautifully suited for TF imaging)

But... field to field variation is an issue!!!

Raw estimates for no evolution and concordance cosmology

Summary

- OSIRIS instrument at the 10m GTC already gathering data
- OSIRIS TFs @10m GTC optimally suited for detecting Ly- α
 - at very faint levels ($\sim 10^{41}$ erg/s)
 - low EWs (~2-3)
 - with low surface brightness
- Tunable tomography surveys OTELO & HORUS starting
- Yielding Ly- α plus other emitters from $z = 0.2$ to 7.0
- Hope to show results the next meeting!
- Expected follow-ups:
 - R=5000 for kinematics
 - NIR spectroscopy of optical lines
